

**Dirt is the leading cause of system failure...  
And is the easiest factor to control through proper filtration.**

The Blower Wheel in your system moves air from your living areas, through your system where it is conditioned (either warmed or cooled) and then returned back to all the rooms in your house. It's a big job moving up to 5 tons of air throughout your home.

**A dirty blower wheel behaves a lot differently than a clean wheel.**

- Airflow is reduced causing temperatures in the furnace to rise to dangerous levels during the heating cycle because the heated air doesn't move out properly, causing limit switches to trigger and shutting your system down.
- The blower motor works harder and longer, costing you money every day.
- Inefficient air flow causes the compressor in your outdoor unit to work longer and harder, shortening its life, and certainly costing you more money.
- Dirty blower wheels can run off balance, straining motor bearings. This often begins as more noise from the system and turns to higher repair costs.

**Dirty and Costly**

**Clean and Efficient**

Thank you for recently considering RS Andrews for a service on your heating and cooling system. People choose RS Andrews because we stand behind our work. In addition to terrific parts and labor warranties on everything we do, we will always do work correctly and to your satisfaction.

**An ounce of prevention is worth a pound of cure..**

Call RS Andrews today, to learn about the many options available to keep your home comfort system clean and running strong toward a long life.
